

Midterm Review

Kongsak Tipakornrojanakit [5680624]

Formulas:

$$\text{Equal Payment Amortization} \quad C = \frac{\text{PVA}}{\text{PVIFA}(r, t)} \quad (1)$$

$$\text{Future Value Interest Factor} \text{FVIF}(r, t) = (1 + r)^t \quad (2)$$

$$\text{Present Value Interest Factor} \text{PVIF}(r, t) = \frac{1}{(1 + r)^t} \quad (3)$$

$$1. \quad (a) \quad C_{50-\text{months}} = \frac{\text{PVA}}{\text{PVIFA}(r, t)} = \frac{2,139,423}{\text{PVIFA}(1.01, 62 - 12)} = \frac{2,139,423}{39.196} = 54,582.5233 \text{ Baht per Month}$$

$$\text{Total is } 54,582.5233 \times 50 = 2,729,126.167 \text{ Baht}$$

$$C_{62-\text{months}} = \frac{2,729,126.167}{62} = 44,018.16398 \text{ Baht}$$

$$(b) \quad \text{PVA}_{24-\text{months}} = c \times \text{PVIFA}(r, t) = 50,000 \times \text{PVIFA}(1, 24)$$

$$\text{PVA}_{24-\text{months}} = 1,062,169.363$$

$$\text{PVA}_{24-\text{months-onward}} = 2,139,425 - 1,062,169.363 = 1,077,255.637$$

$$1,077,255.637 = 50,000 \times \text{PVIFA}(2, 24)$$

$$1,077,255.637 = 50,000 \times \frac{\left[1 - \frac{1}{(1 + 0.02)^t}\right]}{0.02}$$

$$1,077,255.637 = 2,500,000 \times \left[1 - \frac{1}{(1.02)^t}\right]$$

$$0.4309022548 = 1 - \frac{1}{(1.02)^t}$$

$$\frac{1}{0.5690977452} = (1.02)^t$$

$$\log_{1.02} \left(\frac{1}{0.5690977452} \right) = \log_{1.02} (1.02)^t$$

$$28.46607508 = t$$

$$\text{Total Months} = 24 + 28.46607508 = 52.46607508 \text{ months}$$

$$2. \quad (a) \quad \text{FVIF}_{\text{BBL}} = \text{FVIF} \left(\frac{8.95}{6}, 1 \times 6 \right) = 1.0929$$

$$\text{FVIF}_{\text{SCB}} = \text{FVIF} \left(\frac{9.00}{3}, 1 \times 3 \right) = 1.0927$$

$$\text{FVIF}_{\text{TFB}} = \text{FVIF} \left(\frac{9.05}{2}, 1 \times 2 \right) = 1.0925$$

Since FVIF_{TFB} has the lowest **Effective Annual Rate**; therefore, it is the cheapest choice to go with.

(b) **Note: Only the first two years**

$$C = \frac{\text{PVA}}{\text{PVIFA}(r, t)} = \frac{1.6 \times 10^6}{\text{PVIFA} \left(\frac{9.00}{3}, 10 \times 3 \right)} = \frac{1.6 \times 10^6}{19.60} = 81,630.8149 \text{ Baht per 4 Months}$$

Total for the first two years = $81,630.8149 \times 3 \times 2 = 489,784.8895$ Baht Let $F = 489,784.8895$

$$\therefore I_0 + I_1 + \cdots + I_n = (B_0 + B_1 + \cdots + B_n) \times r$$

$$\therefore B_0 + B_1 + \cdots + B_n = \frac{(B_0 + B_n) \times n}{2}$$

$$\therefore I_0 + I_1 + \cdots + I_n = \frac{(B_0 + B_n) \times n \times r}{2}$$

$$\therefore B_n = B_0 - F$$

$$\therefore \sum_{x=0}^n I_x = \frac{(2B_0 - F) \times n \times r}{2}$$

$$\begin{aligned} \sum_{x=0}^6 I_x &= \frac{(2(1.6 \times 10^6) - 489,784.8895) \times 6 \times \frac{0.09}{3}}{2} \\ &= ((3.2 \times 10^6) - 489,784.8895) \times 0.09 \\ &= 243,919.36 \end{aligned}$$

$$\begin{aligned} \sum_{x=0}^6 P_x &= F - \sum_{x=0}^6 I_x \\ &= 489,784.8895 - 243,919.36 \\ &= 245,865.5296 \end{aligned}$$
